

# Package ‘crmPack’

September 9, 2014

**Maintainer** Daniel Sabanes Bove <sabanesd@roche.com>

**License** GPL (>= 2)

**Title** Object-oriented implementation of CRM designs

**LinkingTo** Rcpp, RcppArmadillo

**LazyLoad** yes

**Author** Daniel Sabanes Bove <sabanesd@roche.com>

**Description** Object-oriented implementation of CRM designs

**Version** 0.0-16

**Date** 2014-09-09

**Depends** R (>= 3.0.0), Rcpp (>= 0.10.6), RcppArmadillo (>= 0.3.920), ggplot2, rcppbugs

**Imports** methods, R2WinBUGS, gridExtra, GenSA, mvtnorm, parallel, BayesLogit, rjags

**Suggests** ggmcmc, grid

**Collate** 'Data-class.R' 'Data-methods.R' 'helpers.R' 'Rules-class.R' 'Model-class.R' 'Design-class.R'  
'McmcOptions-class.R' 'McmcOptions-methods.R' 'Samples-class.R' 'Model-methods.R'

crmPack-package	<i>Object-oriented implementation of CRM designs</i>
-----------------	--

---

### Description

Object-oriented implementation of CRM designs

### Author(s)

Daniel Sabanes Bove <sabanesd@roche.com>

---

approximate	<i>Approximate posterior with (log) normal distribution</i>
-------------	---

---

### Description

Approximate posterior with (log) normal distribution

### Usage

```
approximate(object, ...)
```

### Arguments

object	the object
...	unused

### Value

the approximation model

---

approximate, Samples-method

*Approximate posterior with (log) normal distribution*

---

### Description

It is recommended to use [set.seed](#) before, in order to be able to reproduce the resulting approximating model exactly.

### Usage

```
## S4 method for signature 'Samples'
approximate(object, model, data, points = seq(from =
  min(data@doseGrid), to = max(data@doseGrid), length = 5L),
  refDose = median(points), logNormal = FALSE, verbose = TRUE, ...)
```

### Arguments

object	the <a href="#">Samples</a> object
model	the <a href="#">Model</a> object
data	the <a href="#">Data</a> object
points	optional parameter, which gives the dose values at which the approximation should rely on (default: 5 values equally spaced from minimum to maximum of the dose grid)
refDose	the reference dose to be used (default: median of points)
logNormal	use the log-normal prior? (not default) otherwise, the normal prior for the logistic regression coefficients is used
verbose	be verbose (progress statements and plot)? (default)
...	additional arguments for <a href="#">Quantiles2LogisticNormal</a> , e.g. in order to control the approximation quality, etc.
...	unused

### Value

the approximation [Model](#)

---

as.list, Data-method      *as.list method for the "Data" class*

---

### Description

as.list method for the "Data" class

### Usage

```
## S4 method for signature 'Data'
as.list(x, ...)
```

Arguments

x                    the [Data](#) object we want to convert  
...                   objects, possibly named.

Value

a list of all slots in x

---

CohortSize-class	<i>The virtual class for cohort sizes</i>
------------------	---

---

Description

The virtual class for cohort sizes

See Also

[CohortSizeMax](#), [CohortSizeMin](#), [CohortSizeRange](#), [CohortSizeDLT](#), [CohortSizeConst](#), [CohortSizeParts](#)

---

CohortSizeConst-class	<i>Constant cohort size</i>
-----------------------	-----------------------------

---

Description

This class is used when the cohort size should be kept constant.

Slots

size   the constant integer size

---

CohortSizeDLT-class	<i>Cohort size based on number of DLTs</i>
---------------------	--

---

Description

Cohort size based on number of DLTs

Slots

DLTintervals   a vector with the bounds of the relevant DLT intervals of length n  
cohortSize   an integer vector of length n-1 with the cohort sizes in the DLTintervals

---

CohortSizeMax-class	<i>Size based on maximum of multiple cohort size rules</i>
---------------------	--

---

**Description**

This class can be used to combine multiple cohort size rules with the MAX operation.

**Details**

cohortSizeList contains all cohort size rules, which are again objects of class [CohortSize](#). The maximum of these individual cohort sizes is taken to give the final cohort size.

**Slots**

cohortSizeList list of cohort size rules

---

CohortSizeMin-class	<i>Size based on minimum of multiple cohort size rules</i>
---------------------	--

---

**Description**

This class can be used to combine multiple cohort size rules with the MIN operation.

**Details**

cohortSizeList contains all cohort size rules, which are again objects of class [CohortSize](#). The minimum of these individual cohort sizes is taken to give the final cohort size.

**Slots**

cohortSizeList list of cohort size rules

---

CohortSizeParts-class	<i>Cohort size based on the parts</i>
-----------------------	---------------------------------------

---

**Description**

This class is used when the cohort size should change for the second part of the dose escalation. Only works in conjunction with [DataParts](#) objects.

**Slots**

sizes the two sizes for part 1 and part 2

---

CohortSizeRange-class    *Cohort size based on dose range*

---

### Description

Cohort size based on dose range

### Slots

intervals a vector with the bounds of the relevant dose intervals of length n

cohortSize an integer vector of length n-1 with the cohort sizes in the intervals

---

Data-class    *Class for the data input*

---

### Description

Class for the data input

### Slots

x the doses for the patients

y the vector of toxicity events (0 or 1 integers)

ID unique patient IDs (integer vector)

cohort the cohort indices (sorted values from 0, 1, 2, ...)

doseGrid the vector of all possible doses (sorted), i.e. the dose grid

nObs number of observations

nGrid number of gridpoints

xLevel the levels for the doses the patients have been given

---

DataDual-class    *Class for the dual endpoint data input*

---

### Description

This is a subclass of [Data](#), so contains all slots from [Data](#), and in addition biomarker values.

### Slots

w the continuous vector of biomarker values

---

DataParts-class	<i>Class for the data with two study parts</i>
-----------------	--

---

**Description**

This is a subclass of [Data](#), so contains all slots from [Data](#), and in addition information on the two study parts.

**Slots**

part integer vector; which part does each of the patients belong to?  
 nextPart integer; what is the part for the next cohort?  
 part1Ladder sorted numeric vector; what is the escalation ladder for part 1? This shall be a subset of the doseGrid.

---

Design-class	<i>Class for the CRM design</i>
--------------	---------------------------------

---

**Description**

Class for the CRM design

**Slots**

model the model to be used, an object of class [Model](#)  
 nextBest how to find the next best dose, an object of class [NextBest](#)  
 stopping stopping rule(s) for the trial, an object of class [Stopping](#)  
 increments how to control increments between dose levels, an object of class [Increments](#)  
 cohortSize rules for the cohort sizes, an object of class [CohortSize](#)  
 data what is the dose grid, any previous data, etc., contained in an object of class [Data](#)  
 startingDose what is the starting dose? Must lie on the grid in data

---

dose	<i>Compute the doses for a given probability, given model and samples</i>
------	---

---

**Description**

Compute the doses for a given probability, given model and samples

**Usage**

```
dose(prob, model, samples, ...)
```

**Arguments**

prob	the probability
model	the <a href="#">Model</a>
samples	the <a href="#">Samples</a>
...	unused

---

dose,numeric,Model,Samples-method

*Compute the doses for a given probability, given model and samples*

---

### Description

Compute the doses for a given probability, given model and samples

### Usage

```
## S4 method for signature 'numeric,Model,Samples'
dose(prob, model, samples, ...)
```

### Arguments

prob	the probability
model	the <a href="#">Model</a>
samples	the <a href="#">Samples</a>
...	unused

---

DualEndpoint-class      *Dual endpoint model*

---

### Description

todo: describe the model

### Slots

mu For the probit toxicity model, mu contains the prior mean vector

Sigma For the probit toxicity model, contains the prior covariance matrix

sigma2betaW For the biomarker model, contains the prior variance factor of the random walk prior.  
If it is not a single number, it can also contain a vector with elements a and b for the inverse-gamma prior on sigma2betaW.

sigma2W Either a fixed value for the biomarker variance, or a vector with elements a and b for the inverse-gamma prior parameters.

rho Either a fixed value for the correlation (between -1 and 1), or a vector with elements a and b for the Beta prior on the transformation  $\kappa = (\rho + 1) / 2$ , which is in (0, 1). For example, a=1, b=1 leads to a uniform prior on rho.

useRW1 for specifying the random walk prior on the biomarker level: if TRUE, RW1 is used, otherwise RW2.

useFixed a list with logical value for each of the three parameters sigma2betaW, sigma2W and rho indicating whether a fixed value is used or not.

---

extract	<i>Extract something from an object and produce a data.frame</i>
---------	--

---

**Description**

Extract something from an object and produce a data.frame

**Usage**

```
extract(object, ...)
```

**Arguments**

object	the object
...	unused

**Value**

the data frame

---

extract, Samples-method	<i>Extract certain parameter from Samples object</i>
-------------------------	--

---

**Description**

Extract certain parameter from Samples object

**Usage**

```
## S4 method for signature 'Samples'
extract(object, parameter, ...)
```

**Arguments**

object	the <a href="#">Samples</a> object
parameter	the name of the parameter
...	unused

**Value**

the data frame suitable for use with [ggmcmc](#)

---

fitted, Samples-method    *Fit method for the Samples class*

---

### Description

Fit method for the Samples class

### Usage

```
## S4 method for signature 'Samples'
fitted(object, model, data, points = data@doseGrid,
       quantiles = c(0.025, 0.975), middle = mean, ...)
```

### Arguments

object	the <a href="#">Samples</a> object
model	the <a href="#">Model</a> object
data	the <a href="#">Data</a> object
points	at which dose levels is the fit requested? default is the dose grid
quantiles	the quantiles to be calculated (default: 0.025 and 0.975)
middle	the function for computing the middle point. Default: <a href="#">mean</a>
...	other arguments.

### Value

data frame with dose, middle, lower and upper quantiles

---

Increments-class    *The virtual class for controlling increments*

---

### Description

The virtual class for controlling increments

### See Also

[IncrementsRelative](#), [IncrementsRelativeDLT](#), [IncrementsRelativeParts](#)

---

IncrementsRelative-class    *Increments control based on relative differences in intervals*

---

### Description

Increments control based on relative differences in intervals

### Slots

intervals    a vector with the bounds of the relevant intervals of length n  
 increments    a vector of length n-1 with the maximum allowable relative increments in the intervals

---

IncrementsRelativeDLT-class

*Increments control based on relative differences in terms of DLTs*

---

### Description

Increments control based on relative differences in terms of DLTs

### Slots

`DLTintervals` a vector with the bounds of the relevant DLT intervals of length `n`

`increments` a vector of length `n-1` with the maximum allowable relative increments in the `DLTintervals`

---

IncrementsRelativeParts-class

*Increments control based on relative differences in intervals, with special rules for part 1 and beginning of part 2*

---

### Description

Note that this only works in conjunction with [DataParts](#) objects. If the part 2 will just be started in the next cohort, then the next maximum dose will be either `dltStart` (e.g. -1) shift of the last part 1 dose in case of a DLT in part 1, or `cleanStart` shift (e.g. 0) in case of no DLTs in part 1. If part 1 will still be on in the next cohort, then the next dose level will be the next higher dose level in the `part1Ladder` of the data object. If part 2 has been started before, the usual relative increment rules apply, see [IncrementsRelative](#). Slots

`dltStart` integer giving the dose level increment for starting part 2 in case of a DLT in part 1

`cleanStart` integer giving the dose level increment for starting part 2 in case of a DLT in part 1. If this is less or equal to 0, then the part 1 ladder will be used to find the maximum next dose. If this is larger than 0, then the relative increment rules will be applied to find the next maximum dose level.

classes

---

`initialize,Data-method`
*Initialization method for the "Data" class*

---

### Description

This is the method for initializing a "Data" class object.

### Usage

```
## S4 method for signature 'Data'
initialize(Object, x = numeric(), y = integer(),
  ID = integer(), cohort = integer(), doseGrid = numeric(), ...)
```

**Arguments**

.Object	the <a href="#">Data</a> we want to initialize
x	the doses for the patients
y	the vector of toxicity events (0 or 1 integers)
ID	unique patient IDs (integer vector)
cohort	the cohort indices (sorted values from 0, 1, 2, ...)
doseGrid	the vector of all possible doses
...	data to include in the new object. Named arguments correspond to slots in the class definition. Unnamed arguments must be objects from classes that this class extends.

**Details**

Note that ID and cohort can be missing, then a warning will be issued and the variables will be filled with default IDs and best guesses, respectively.

---

```
initialize,DualEndpoint-method
```

*Initialization method for the "DualEndpoint" class*

---

**Description**

Initialization method for the "DualEndpoint" class

**Usage**

```
## S4 method for signature 'DualEndpoint'
initialize(.Object, mu, Sigma, sigma2betaW, sigma2W,
  rho, smooth = c("RW1", "RW2"), ...)
```

**Arguments**

.Object	the <a href="#">DualEndpoint</a> we want to initialize
mu	see <a href="#">DualEndpoint</a>
Sigma	see <a href="#">DualEndpoint</a>
sigma2betaW	see <a href="#">DualEndpoint</a>
sigma2W	see <a href="#">DualEndpoint</a>
rho	see <a href="#">DualEndpoint</a>
smooth	either "RW1" (default) or "RW2", for specifying the random walk prior on the biomarker level.
...	data to include in the new object. Named arguments correspond to slots in the class definition. Unnamed arguments must be objects from classes that this class extends.

---

```
initialize,LogisticKadane-method
```

*Initialization method for the "LogisticKadane" class*

---

### Description

Initialization method for the "LogisticKadane" class

### Usage

```
## S4 method for signature 'LogisticKadane'
initialize(.Object, theta, xmin, xmax, ...)
```

### Arguments

.Object	the <a href="#">LogisticKadane</a> we want to initialize
theta	the target toxicity probability
xmin	the minimum of the dose range
xmax	the maximum of the dose range
...	data to include in the new object. Named arguments correspond to slots in the class definition. Unnamed arguments must be objects from classes that this class extends.

---

```
initialize,LogisticLogNormal-method
```

*Initialization method for the "LogisticLogNormal" class*

---

### Description

Initialization method for the "LogisticLogNormal" class

### Usage

```
## S4 method for signature 'LogisticLogNormal'
initialize(.Object, mean, cov, refDose, ...)
```

### Arguments

.Object	the <a href="#">LogisticLogNormal</a> we want to initialize
mean	the prior mean vector
cov	the prior covariance matrix
refDose	the reference dose
...	data to include in the new object. Named arguments correspond to slots in the class definition. Unnamed arguments must be objects from classes that this class extends.

---

```
initialize,LogisticNormal-method
```

*Initialization method for the "LogisticNormal" class*

---

### Description

Initialization method for the "LogisticNormal" class

### Usage

```
## S4 method for signature 'LogisticNormal'
initialize(.Object, mean, cov, refDose, ...)
```

### Arguments

.Object	the <a href="#">LogisticNormal</a> we want to initialize
mean	the prior mean vector
cov	the prior covariance matrix
refDose	the reference dose
...	data to include in the new object. Named arguments correspond to slots in the class definition. Unnamed arguments must be objects from classes that this class extends.

---

```
initialize,LogisticNormalFixedMixture-method
```

*Initialization method for the "LogisticNormalFixedMixture" class*

---

### Description

Initialization method for the "LogisticNormalFixedMixture" class

### Usage

```
## S4 method for signature 'LogisticNormalFixedMixture'
initialize(.Object, components, weights,
  refDose, logNormal = FALSE, ...)
```

### Arguments

.Object	the <a href="#">LogisticNormalFixedMixture</a> we want to initialize
components	the specifications of the mixture components: a list with one list of mean and cov for each bivariate (log) normal prior
weights	the weights of the components, these must be positive and will be normalized to sum to 1
refDose	the reference dose
logNormal	should a log normal prior be specified, such that the mean vectors and covariance matrices are valid for the intercept and log slope? (not default)
...	data to include in the new object. Named arguments correspond to slots in the class definition. Unnamed arguments must be objects from classes that this class extends.

---

```
initialize,LogisticNormalMixture-method
```

*Initialization method for the "LogisticNormalMixture" class*

---

## Description

Initialization method for the "LogisticNormalMixture" class

## Usage

```
## S4 method for signature 'LogisticNormalMixture'
initialize(.Object, comp1, comp2, weightpar,
  refDose, ...)
```

## Arguments

.Object	the <a href="#">LogisticNormalMixture</a> we want to initialize
comp1	the specifications of the first component: a list with mean and cov for the first bivariate normal prior
comp2	the specifications of the second component
weightpar	the beta parameters for the weight of the first component
refDose	the reference dose
...	data to include in the new object. Named arguments correspond to slots in the class definition. Unnamed arguments must be objects from classes that this class extends.

---

```
initialize,McmcOptions-method
```

*Initialization method for the "McmcOptions" class*

---

## Description

Initialization method for the "McmcOptions" class

## Usage

```
## S4 method for signature 'McmcOptions'
initialize(.Object, burnin = 10000L, step = 2L,
  samples = 10000L, ...)
```

## Arguments

.Object	the <a href="#">McmcOptions</a> we want to initialize
burnin	number of burn-in iterations which are not saved (default: 10,000)
step	only every step-th iteration is saved after the burn-in (default: 2)
samples	number of resulting samples (by default 10,000 will result)
...	data to include in the new object. Named arguments correspond to slots in the class definition. Unnamed arguments must be objects from classes that this class extends.

---

LogisticKadane-class    *Reparametrized logistic model*

---

### Description

This is the logistic model in the parametrization of Kadane et al. (1980).

### Details

Let  $\rho_0 = p(x_{min})$  be the probability of a DLT and the minimum dose  $x_{min}$ , and let  $\gamma$  be the dose with target toxicity probability  $\theta$ , i.e.  $p(\gamma) = \theta$ . Then it can easily be shown that the logistic regression model has intercept

$$\frac{\gamma \text{logit}(\rho_0) - x_{min} \text{logit}(\theta)}{\gamma - x_{min}}$$

and slope

$$\frac{\text{logit}(\theta) - \text{logit}(\rho_0)}{\gamma - x_{min}}$$

The prior is a uniform distribution for  $\gamma$  between  $x_{min}$  and  $x_{max}$ , and for  $\rho_0$  as well a uniform distribution between 0 and  $\theta$ .

The slots of this class, required for creating the model, are the target toxicity, as well as the minimum and maximum of the dose range. Note that these can be different from the minimum and maximum of the dose grid in the data later on.

### Slots

theta the target toxicity probability  $\theta$   
xmin the minimum of the dose range  $x_{min}$   
xmax the maximum of the dose range  $x_{max}$

---

LogisticLogNormal-class

*Standard logistic model with bivariate (log) normal prior*

---

### Description

This is the usual logistic regression model with a bivariate normal prior on the intercept and log slope.

### Details

The covariate is the natural logarithm of the dose  $x$  divided by the reference dose  $x^*$ :

$$\text{logit}[p(x)] = \alpha + \beta \cdot \log(x/x^*)$$

where  $p(x)$  is the probability of observing a DLT for a given dose  $x$ .

The prior is

$$(\alpha, \log(\beta)) \sim \text{Normal}(\mu, \Sigma)$$

The slots of this class contain the mean vector and the covariance matrix of the bivariate normal distribution, as well as the reference dose.

**Slots**

mean the prior mean vector  $\mu$   
 cov the prior covariance matrix  $\Sigma$   
 refDose the reference dose  $x^*$

---

LogisticNormal-class    *Standard logistic model with bivariate normal prior*

---

**Description**

This is the usual logistic regression model with a bivariate normal prior on the intercept and slope.

**Details**

The covariate is the natural logarithm of the dose  $x$  divided by the reference dose  $x^*$ :

$$\text{logit}[p(x)] = \alpha + \beta \cdot \log(x/x^*)$$

where  $p(x)$  is the probability of observing a DLT for a given dose  $x$ .

The prior is

$$(\alpha, \beta) \sim \text{Normal}(\mu, \Sigma)$$

The slots of this class contain the mean vector, the covariance and precision matrices of the bivariate normal distribution, as well as the reference dose.

**Slots**

mean the prior mean vector  $\mu$   
 cov the prior covariance matrix  $\Sigma$   
 prec the prior precision matrix  $\Sigma^{-1}$   
 refDose the reference dose  $x^*$

---

LogisticNormalFixedMixture-class  
                                   *Standard logistic model with fixed mixture of multiple bivariate (log)  
                                   normal priors*

---

**Description**

This is standard logistic regression model with a mixture of multiple bivariate (log) normal priors on the intercept and slope parameters. The weights of the normal priors are fixed, hence no additional model parameters are introduced. This type of prior is often used to better approximate a given posterior distribution, or when the information is given in terms of a mixture.

## Details

The covariate is the natural logarithm of the dose  $x$  divided by the reference dose  $x^*$ :

$$\text{logit}[p(x)] = \alpha + \beta \cdot \log(x/x^*)$$

where  $p(x)$  is the probability of observing a DLT for a given dose  $x$ .

The prior is

$$(\alpha, \beta) \sim \sum_{j=1}^K w_j \text{Normal}(\mu_j, \Sigma_j)$$

if a normal prior is used and

$$(\alpha, \log(\beta)) \sim \sum_{j=1}^K w_j \text{Normal}(\mu_j, \Sigma_j)$$

if a log normal prior is used.

The weight  $w_j$  of the components are fixed and sum to 1.

The (additional) slots of this class comprise two lists, containing the mean vector, the covariance and precision matrices of the two bivariate normal distributions each, the parameters of the beta prior for the first component weight, as well as the reference dose. Moreover, a slot specifies whether a log normal prior is used.

## Slots

**components** a list with one entry per component of the mixture. Each entry is a list with mean, cov and prec for the bivariate normal prior

**weights** the weights of the components, these must be positive and sum to 1

**refDose** the reference dose  $x^*$

**logNormal** is a log normal prior specified for each of the components?

---

LogisticNormalMixture-class

*Standard logistic model with flexible mixture of two bivariate normal priors*

---

## Description

This is standard logistic regression model with a mixture of two bivariate normal priors on the intercept and slope parameters. The weight of the two normal priors is a model parameter, hence it is a flexible mixture. This type of prior is often used with a mixture of a minimal informative and an informative component, in order to make the CRM more robust to data deviations from the informative component.

**Details**

The covariate is the natural logarithm of the dose  $x$  divided by the reference dose  $x^*$ :

$$\text{logit}[p(x)] = \alpha + \beta \cdot \log(x/x^*)$$

where  $p(x)$  is the probability of observing a DLT for a given dose  $x$ .

The prior is

$$(\alpha, \beta) \sim w * \text{Normal}(\mu_1, \Sigma_1) + (1 - w) * \text{Normal}(\mu_2, \Sigma_2)$$

The weight  $w$  for the first component is assigned a beta prior  $B(a, b)$ .

The slots of this class comprise two lists, containing the mean vector, the covariance and precision matrices of the two bivariate normal distributions each, the parameters of the beta prior for the first component weight, as well as the reference dose.

**Slots**

comp1 the specifications of the first component: a list with mean, cov and prec for the first bivariate normal prior

comp2 the specifications of the second component

weightpar the beta parameters for the weight of the first component

refDose the reference dose  $x^*$

---

logit

*Shorthand for logit function*

---

**Description**

Shorthand for logit function

**Usage**

```
logit(x)
```

**Arguments**

x the function argument

**Value**

the logit(x)

---

maxDose	<i>Determine the maximum possible next dose</i>
---------	---

---

### Description

Determine the upper limit of the next dose based on the increments rule.

### Usage

```
maxDose(increments, data, ...)
```

### Arguments

increments	The rule, an object of class <a href="#">Increments</a>
data	The data input, an object of class <a href="#">Data</a>
...	further arguments

### Details

This function outputs the maximum possible next dose, based on the corresponding rule increments and the data.

### Value

the maximum possible next dose

---

maxDose, IncrementsRelative, Data-method
<i>Determine the maximum possible next dose based on relative increments</i>

---

### Description

Determine the maximum possible next dose based on relative increments

### Usage

```
## S4 method for signature 'IncrementsRelative,Data'
maxDose(increments, data, ...)
```

### Arguments

increments	The rule, an object of class <a href="#">Increments</a>
data	The data input, an object of class <a href="#">Data</a>
...	further arguments

---

maxDose, IncrementsRelativeDLT, Data-method

*Determine the maximum possible next dose based on relative increments determined by DLTs so far*

---

### Description

Determine the maximum possible next dose based on relative increments determined by DLTs so far

### Usage

```
## S4 method for signature 'IncrementsRelativeDLT,Data'
maxDose(increments, data, ...)
```

### Arguments

increments	The rule, an object of class <a href="#">Increments</a>
data	The data input, an object of class <a href="#">Data</a>
...	further arguments

---

maxDose, IncrementsRelativeParts, DataParts-method

*Determine the maximum possible next dose based on relative increments and part 1 and 2*

---

### Description

Determine the maximum possible next dose based on relative increments and part 1 and 2

### Usage

```
## S4 method for signature 'IncrementsRelativeParts,DataParts'
maxDose(increments, data, ...)
```

### Arguments

increments	The rule, an object of class <a href="#">Increments</a>
data	The data input, an object of class <a href="#">Data</a>
...	further arguments

---

maxSize	<i>"MAX" combination of cohort size rules</i>
---------	---

---

**Description**

This function combines cohort size rules by taking the maximum of all sizes.

**Usage**

```
maxSize(...)
```

**Arguments**

...                      Objects of class [CohortSize](#)

**Value**

the combination as an object of class [CohortSizeMax](#)

**See Also**

[minSize](#)

---

maxSize, CohortSize-method
<i>The method combining cohort size rules by taking maximum</i>

---

**Description**

The method combining cohort size rules by taking maximum

**Usage**

```
## S4 method for signature 'CohortSize'  
maxSize(...)
```

**Arguments**

...                      Objects of class [CohortSize](#)

---

mcmc	<i>Obtain posterior samples for all model parameters</i>
------	--

---

**Description**

Obtain posterior samples for all model parameters

**Usage**

```
mcmc(data, model, options, ...)
```

**Arguments**

data	The data input, an object of class <a href="#">Data</a>
model	The model input, an object of class <a href="#">Model</a>
options	MCMC options, an object of class <a href="#">McmcOptions</a>
...	unused

**Details**

This is the function to actually run the MCMC machinery to produce posterior samples from all model parameters and required derived values. It is a generic function, so that customized versions may be conveniently defined for specific subclasses of [Data](#), [Model](#), and [McmcOptions](#) input.

**Value**

The posterior samples, an object of class [Samples](#).

---

mcmc, Data, LogisticLogNormal, McmcOptions-method
<i>The fast method for the LogisticLogNormal class</i>

---

**Description**

The fast method for the [LogisticLogNormal](#) class

**Usage**

```
## S4 method for signature 'Data,LogisticLogNormal,McmcOptions'
mcmc(data, model, options,
      verbose = FALSE, ...)
```

**Arguments**

verbose	shall messages be printed? (not default)
data	The data input, an object of class <a href="#">Data</a>
model	The model input, an object of class <a href="#">Model</a>
options	MCMC options, an object of class <a href="#">McmcOptions</a>
...	unused

---

mcmc,Data,LogisticNormal,McmcOptions-method

*The fast method for the LogisticNormal class*

---

### Description

The fast method for the LogisticNormal class

### Usage

```
## S4 method for signature 'Data,LogisticNormal,McmcOptions'
mcmc(data, model, options,
      verbose = FALSE, ...)
```

### Arguments

verbose	shall messages be printed? (not default)
data	The data input, an object of class <a href="#">Data</a>
model	The model input, an object of class <a href="#">Model</a>
options	MCMC options, an object of class <a href="#">McmcOptions</a>
...	unused

---

mcmc,Data,Model,McmcOptions-method

*Standard method which uses JAGS/BUGS*

---

### Description

Standard method which uses JAGS/BUGS

### Usage

```
## S4 method for signature 'Data,Model,McmcOptions'
mcmc(data, model, options,
      program = c("JAGS", "OpenBUGS", "WinBUGS"), verbose = FALSE, ...)
```

### Arguments

program	the program which shall be used: either “JAGS” (default), “OpenBUGS” or “WinBUGS”
verbose	shall messages be printed? (not default)
data	The data input, an object of class <a href="#">Data</a>
model	The model input, an object of class <a href="#">Model</a>
options	MCMC options, an object of class <a href="#">McmcOptions</a>
...	unused

---

McmcOptions-class	<i>Class for the three canonical MCMC options</i>
-------------------	---

---

**Description**

Class for the three canonical MCMC options

**Slots**

iterations number of MCMC iterations  
 burnin number of burn-in iterations which are not saved  
 step only every step-th iteration is saved after the burn-in

---

MinimalInformative	<i>Construct a minimally informative prior</i>
--------------------	--

---

**Description**

This function constructs a minimally informative prior, which is captured in a [LogisticNormal](#) object.

**Usage**

```
MinimalInformative(dosegrid, refDose, threshmin = 0.2, threshmax = 0.3, ...)
```

**Arguments**

dosegrid	the dose grid
refDose	the reference dose
threshmin	Any toxicity probability above this threshold would be very unlikely (5%) at the minimum dose (default: 0.2)
threshmax	Any toxicity probability below this threshold would be very unlikely (5%) at the maximum dose (default: 0.3)
...	additional arguments for computations, see <a href="#">Quantiles2LogisticNormal</a>

**Details**

Based on the proposal by Neuenschwander et al (2008, Statistics in Medicine), a minimally informative prior distribution is constructed. The required key input is the minimum ( $d_1$  in the notation of the Appendix A.1 of that paper) and the maximum value ( $d_J$ ) of the dose grid supplied to this function. Then threshmin is the probability threshold  $q_1$ , such that any probability of DLT larger than  $q_1$  has only 5% probability. Likewise, threshmax is the probability threshold  $q_J$ , such that any probability of DLT smaller than  $q_J$  has only 5% probability. Subsequently, for all doses supplied in the dosegrid argument, Beta distributions are set up, and [Quantiles2LogisticNormal](#) is used to transform the resulting quantiles into an approximating [LogisticNormal](#) model.

**Value**

see [Quantiles2LogisticNormal](#)

---

minSize	<i>"MIN" combination of cohort size rules</i>
---------	---

---

### Description

This function combines cohort size rules by taking the minimum of all sizes.

### Usage

```
minSize(...)
```

### Arguments

...                      Objects of class [CohortSize](#)

### Value

the combination as an object of class [CohortSizeMin](#)

### See Also

## S4 method for signature 'CohortSize'
minSize(...)
```

### Arguments

...                      Objects of class [CohortSize](#)

---

Model-class

---

Class for the model input

---

## Description

This is the general model class, from which all other specific models inherit.

## Details

The `datamodel` must obey the convention that the data input is called exactly as in the [Data](#) class. All prior distributions for parameters should be contained in the model function `priormodel`. The background is that this can be used to simulate from the prior distribution, before obtaining any data.

The dose function has as first argument `prob`, a scalar toxicity probability which is targeted. Additional arguments are model parameters. Then it computes, using model parameter(s) (samples), the resulting dose. Note that the model parameters are called exactly as in the `model` and must be included in the `sample` vector. The vectors of all samples for these parameters will then be supplied to the function. So your function must be able to process vectors of the model parameters, i.e. it must vectorize over them.

The `prob` function has as first argument `dose`, which is a scalar dose. Additional arguments are model parameters. Then it computes, using model parameter(s) (samples), the resulting probability of toxicity at that dose. Again here, the function must vectorize over the model parameters.

If you work with multivariate parameters, then please assume that your the two functions receive either one parameter value as a row vector, or a samples matrix where the rows correspond to the sampling index, i.e. the layout is then `nSamples x dimParameter`.

Note that `dose` and `prob` are the inverse functions of each other.

## Slots

`datamodel` a function representing the BUGS data model specification (see the details above)

`priormodel` a function representing the BUGS prior specification (see the details above)

`datanames` The names of all [Data](#) slots that are used in the `datamodel` and/or `priormodel` definition. Note that you cannot specify more variables than those that are really used in the model!

`modelspecs` a function computing the list of the data model and prior model specifications that are required for fully specifying them (e.g. prior parameters, reference dose, etc.), based on the [Data](#) slots that are then required as arguments of this function. This will then be passed to BUGS for the computations.

`dose` a function computing the dose reaching a specific target probability, based on the model parameters and additional prior settings (see the details above)

`prob` a function computing the probability of toxicity for a specific dose, based on the model parameters and additional prior settings (see the details above)

`init` a function computing the list of starting values for parameters required to be initialized in the MCMC sampler, based on the [Data](#) slots that are then required as arguments of this function

`sample` names of all parameters from which you would like to save the MCMC samples. These must include the ones required by the `dose` and `prob` functions.

---

nextBest	<i>Find the next best dose</i>
----------	--------------------------------

---

Description

Compute the recommended next best dose.

Usage

```
nextBest(nextBest, doselimit, samples, model, data, ...)
```

Arguments

- nextBest      The rule, an object of class [NextBest](#)
- doselimit     The maximum allowed next dose
- samples      the [Samples](#) object
- model        The model input, an object of class [Model](#)
- data         The data input, an object of class [Data](#)
- ...          possible additional arguments without method dispatch

Details

This function outputs the next best dose recommendation based on the corresponding rule `nextBest`, the posterior samples from the `model` and the underlying `data`.

Value

a list with the next best dose (element `value`) on the grid defined in `data`, and a plot depicting this recommendation (element `plot`)

---

NextBestDualEndpoint-class

*The class with the input for finding the next dose based on the dual endpoint model*

---

### Description

The class with the input for finding the next dose based on the dual endpoint model

### Slots

**target** the biomarker level, relative to the maximum, that needs to be reached. For example, 0.9 means that a dose with 90 of the maximum biomarker level is considered as having reached sufficient biomarker level.

**overdose** the overdose toxicity interval

**maxOverdoseProb** maximum overdose probability that is allowed

---

NextBestMTD-class

*The class with the input for finding the next best MTD estimate*

---

### Description

The class with the input for finding the next best MTD estimate

### Slots

**target** the target toxicity probability

**derive** the function which derives from the input, a vector of posterior MTD samples called **mtdSamples**, the final next best MTD estimate.

---

NextBestNCRM-class

*The class with the input for finding the next dose in target interval*

---

### Description

Note that to avoid numerical problems, the dose selection algorithm has been implemented as follows: First admissible doses are found, which are those with probability to fall in overdose category being below **maxOverdoseProb**. Next, within the admissible doses, the maximum probability to fall in the **target** category is calculated. If that is above 5% (i.e., it is not just numerical error), then the corresponding dose is the next recommended dose. Otherwise, the highest admissible dose is the next recommended dose.

### Slots

**target** the target toxicity interval

**overdose** the overdose toxicity interval

**maxOverdoseProb** maximum overdose probability that is allowed

plot,Data,missing-method

*Plot method for the "Data" class*

---

### Description

Plot method for the "Data" class

### Usage

```
## S4 method for signature 'Data,missing'
plot(x, y, ...)
```

### Arguments

x                    the [Data](#) object we want to plot  
y                    the y coordinates of points in the plot, *optional* if x is an appropriate structure.  
...                  Arguments to be passed to methods, such as [graphical parameters](#) (see [par](#)).  
Many methods will accept the following arguments:  
type                what type of plot should be drawn. Possible types are

- "p" for **p**oints,
- "l" for **l**ines,
- "b" for **b**oth,
- "c" for the lines part alone of "b",
- "o" for both '**o**verplotted',

- "h" for 'histogram' like (or 'high-density') vertical lines,
- "s" for stair steps,
- "S" for other steps, see 'Details' below,
- "n" for no plotting.

All other types give a warning or an error; using, e.g., `type = "punkte"` being equivalent to `type = "p"` for S compatibility. Note that some methods, e.g. `plot.factor`, do not accept this.

`main` an overall title for the plot: see [title](#).

`sub` a sub title for the plot: see [title](#).

`xlab` a title for the x axis: see [title](#).

`ylab` a title for the y axis: see [title](#).

`asp` the  $y/x$  aspect ratio, see [plot.window](#).

### Value

the `ggplot` object

*Plot simulations*

---

## Description

Summarize the simulations with plots

## Usage

```
## S4 method for signature 'Simulations,missing'
plot(x, y, type = c("trajectory",
  "dosesTried"), ...)
```

## Arguments

x	the <a href="#">Simulations</a> object we want to plot from
type	the type of plots you want to obtain.
y	the y coordinates of points in the plot, <i>optional</i> if x is an appropriate structure.
...	Arguments to be passed to methods, such as <a href="#">graphical parameters</a> (see <a href="#">par</a> ). Many methods will accept the following arguments: type what type of plot should be drawn. Possible types are <ul style="list-style-type: none"> <li>• "p" for <b>p</b>oints,</li> <li>• "l" for <b>l</b>ines,</li> <li>• "b" for <b>b</b>oth,</li> <li>• "c" for the lines part alone of "b",</li> <li>• "o" for both 'overplotted',</li> <li>• "h" for 'histogram' like (or 'high-density') vertical lines,</li> <li>• "s" for stair steps,</li> <li>• "S" for other steps, see 'Details' below,</li> <li>• "n" for no plotting.</li> </ul> All other types give a warning or an error; using, e.g., type = "punkte" being equivalent to type = "p" for S compatibility. Note that some methods, e.g. <a href="#">plot.factor</a> , do not accept this.

main an overall title for the plot: see [title](#).  
 sub a sub title for the plot: see [title](#).  
 xlab a title for the x axis: see [title](#).  
 ylab a title for the y axis: see [title](#).  
 asp the  $y/x$  aspect ratio, see [plot.window](#).

## Details

This plot method can be applied to [Simulations](#) objects in order to summarize them graphically. Possible types of plots at the moment are:

**trajectory** Summary of the trajectory of the simulated trials

**dosesTried** Average proportions of the doses tested in patients

You can specify one or both of these in the `type` argument.

## Value

A single [ggplot2](#) object if a single plot is asked for, otherwise a [gridExtra](#){gTree} object. The first can be plotted with the `print` command, the latter with the [grid.draw](#) command.

---

```
plot, Simulations-summary, missing-method
```

*Plot summaries of the simulations*

---

## Description

Graphical display of the simulation summary

## Usage

```
## S4 method for signature 'Simulations-summary,missing'
plot(x, y, type = c("nObs",
  "doseSelected", "propDLTs", "nAboveTarget", "meanFit"), ...)
```

## Arguments

`x` the [Simulations-summary](#) object we want to plot from

`type` the types of plots you want to obtain.

`y` the y coordinates of points in the plot, *optional* if `x` is an appropriate structure.

`...` Arguments to be passed to methods, such as [graphical parameters](#) (see [par](#)). Many methods will accept the following arguments:

`type` what type of plot should be drawn. Possible types are

- "p" for **p**oints,
- "l" for **l**ines,
- "b" for **b**oth,
- "c" for the lines part alone of "b",
- "o" for both '**o**verplotted',
- "h" for '**h**istogram' like (or 'high-density') vertical lines,
- "s" for stair steps,
- "S" for other steps, see 'Details' below,
- "n" for no plotting.

All other types give a warning or an error; using, e.g., `type = "punkte"` being equivalent to `type = "p"` for S compatibility. Note that some methods, e.g. [plot.factor](#), do not accept this.

**main** an overall title for the plot: see [title](#).  
**sub** a sub title for the plot: see [title](#).  
**xlab** a title for the x axis: see [title](#).  
**ylab** a title for the y axis: see [title](#).  
**asp** the  $y/x$  aspect ratio, see [plot.window](#).

## Details

This plot method can be applied to [Simulations](#) objects in order to summarize them graphically. Possible types of plots at the moment are:

**nObs** Distribution of the number of patients in the simulated trials

**doseSelected** Distribution of the final selected doses in the trials. Note that this can include zero entries, meaning that the trial was stopped because all doses in the dose grid appeared too toxic.

**propDLTs** Distribution of the proportion of patients with DLTs in the trials

**nAboveTarget** Distribution of the number of patients treated at doses which are above the target toxicity interval (as specified by the truth and target arguments to [summary, Simulations-method](#))

**meanFit** Plot showing the average fitted dose-toxicity curve across the trials, together with 95% credible intervals, and comparison with the assumed truth (as specified by the truth argument to [summary, Simulations-method](#))

You can specify any subset of these in the `type` argument.

## Value

A single [ggplot2](#) object if a single plot is asked for, otherwise a [gridExtra](#){gTree} object. The first can be plotted with the `print` command, the latter with the `grid.draw` command.

---

prob	<i>Compute the probability for a given dose, given model and samples</i>
------	--

---

## Description

Compute the probability for a given dose, given model and samples

## Usage

```
prob(dose, model, samples, ...)
```

## Arguments

dose	the dose
model	the <a href="#">Model</a>
samples	the <a href="#">Samples</a>
...	unused

---

```
prob,numeric,Model,Samples-method
```

*Compute the probability for a given dose, given model and samples*

---

### Description

Compute the probability for a given dose, given model and samples

### Usage

```
## S4 method for signature 'numeric,Model,Samples'
prob(dose, model, samples, ...)
```

### Arguments

dose	the dose
model	the <a href="#">Model</a>
samples	the <a href="#">Samples</a>
...	unused

---

```
Quantiles2LogisticNormal
```

*Convert prior quantiles (lower, median, upper) to logistic (log) normal model*

---

### Description

This function uses generalised simulated annealing to optimise a [LogisticNormal](#) model to be as close as possible to the given prior quantiles.

### Usage

```
Quantiles2LogisticNormal(dosegrid, refDose, lower, median, upper,
  level = 0.95, logNormal = FALSE, parstart = NULL, parlower = c(-10,
  -10, 0, 0, -0.95), parupper = c(10, 10, 10, 10, 0.95), verbose = TRUE,
  control = list(threshold.stop = 0.01, maxit = 50000, temperature = 50000,
  max.time = 600))
```

### Arguments

dosegrid	the dose grid
refDose	the reference dose
lower	the lower quantiles
median	the medians
upper	the upper quantiles
level	the credible level of the (lower, upper) intervals (default: 0.95)

logNormal	use the log-normal prior? (not default) otherwise, the normal prior for the logistic regression coefficients is used
parstart	starting values for the parameters. By default, these are determined from the medians supplied.
parlower	lower bounds on the parameters (intercept alpha and the slope beta, the corresponding standard deviations and the correlation.)
parupper	upper bounds on the parameters
verbose	be verbose? (default)
control	additional options for the optimisation routine, see <a href="#">GenSA</a> for more details

**Value**

a list with the best approximating model ([LogisticNormal](#) or [LogisticLogNormal](#)), the resulting quantiles, the required quantiles and the distance to the required quantiles, as well as the final parameters (which could be used for running the algorithm a second time)

---

Samples-class	<i>Class for the MCMC output</i>
---------------	----------------------------------

---

**Description**

Class for the MCMC output

**Slots**

**data** a list where each entry contains the samples of a (vector-valued) parameter in a vector/matrix in the format (number of samples) x (dimension of the parameter).  
**options** the [McmcOptions](#) which have been used

---

sampleSize	<i>Compute the number of samples for a given MCMC options triple</i>
------------	--

---

**Description**

Compute the number of samples for a given MCMC options triple

**Usage**

```
sampleSize(mcmcOptions)
```

**Arguments**

mcmcOptions     the [McmcOptions](#) object

**Value**

the resulting sample size

---

show, Simulations-summary-method

*Show the summary of the simulations*

---

### Description

Show the summary of the simulations

### Usage

```
## S4 method for signature 'Simulations-summary'
show(object)
```

### Arguments

object                    the [Simulations-summary](#) object we want to print

### Value

invisibly returns a data frame of the results with one row and appropriate column names

---

simulate, Design-method

*Simulate outcomes from a CRM design*

---

### Description

Simulate outcomes from a CRM design

### Usage

```
## S4 method for signature 'Design'
simulate(object, truth, args = NULL,
         firstSeparate = FALSE, nsim = 1L, mcmcOptions = new("McmcOptions"),
         seed = NULL, parallel = FALSE, ...)
```

### Arguments

object	the <a href="#">Design</a> object we want to simulate data from
truth	a function which takes as input a dose (vector) and returns the true probability (vector) for toxicity. Additional arguments can be supplied in args.
args	data frame with arguments for the truth function. The column names correspond to the argument names, the rows to the values of the arguments. The rows are appropriately recycled in the nsim simulations. In order to produce outcomes from the posterior predictive distribution, e.g, pass an object that contains the data observed so far, truth contains the prob function from the model in object, and args contains posterior samples from the model.
firstSeparate	enroll the first patient separately from the rest of the cohort? (not default) If yes, the cohort will be closed if a DLT occurs in this patient.

<code>nsim</code>	the number of simulations (default: 1)
<code>mcmcOptions</code>	object of class <code>McmcOptions</code> , giving the MCMC options for each evaluation in the trial. By default, the standard options are used
<code>seed</code>	an object specifying if and how the random number generator should be initialized (“seeded”). Either NULL (default) or an integer that will be used in a call to <code>set.seed</code> before simulating the response vectors. If set, the value is saved as the seed slot of the returned object. The default, NULL will not change the random generator state, and <code>.Random.seed</code> will be saved.
<code>parallel</code>	should the simulation runs be parallelized across the clusters of the computer? (not default)
<code>...</code>	additional optional arguments.

**Value**

an object of class `Simulations`

---

Simulations-class	<i>Class for the simulations output</i>
-------------------	---

---

**Description**

This class captures the trial simulations.

**Details**

Here also the random generator state before starting the simulation is saved, in order to be able to reproduce the outcome. For this just use `set.seed` with the seed as argument before running `simulate,Design-method`.

**Slots**

`data` list of produced `Data` objects

`doses` the vector of final dose recommendations

`fit` list with the final fits

`stopReasons` list of stopping reasons for each simulation run

`seed` random generator state before starting the simulation

---

Simulations-summary-class

*Class for the summary of simulations output*

---

### Description

Class for the summary of simulations output

### Slots

target target toxicity interval  
 targetDoseInterval corresponding target dose interval  
 nsim number of simulations  
 propDLTs proportions of DLTs in the trials  
 meanToxRisk mean toxicity risks for the patients  
 doseSelected doses selected as MTD  
 toxAtDosesSelected true toxicity at doses selected  
 propAtTarget Proportion of trials selecting target MTD  
 doseMostSelected dose most often selected as MTD  
 obsToxRateAtDoseMostSelected observed toxicity rate at dose most often selected  
 fitAtDoseMostSelected fitted toxicity rate at dose most often selected  
 meanFit list with the average, lower (2.5 quantiles of the mean fitted toxicity at each dose level  
 nObs number of patients overall  
 nAboveTarget number of patients treated above target tox interval  
 doseGrid the dose grid that has been used

---

size

*Determine the size of the next cohort*

---

### Description

This function determines the size of the next cohort.

### Usage

```
size(cohortSize, dose, data, ...)
```

### Arguments

cohortSize	The rule, an object of class <a href="#">CohortSize</a>
dose	the next dose
data	The data input, an object of class <a href="#">Data</a>
...	additional arguments

### Value

the size as integer value

---

size,CohortSizeConst,ANY,Data-method
<i>Constant cohort size</i>

---

**Description**

Constant cohort size

**Usage**

```
## S4 method for signature 'CohortSizeConst,ANY,Data'  
size(cohortSize, dose, data, ...)
```

**Arguments**

cohortSize	The rule, an object of class <a href="#">CohortSize</a>
dose	the next dose
data	The data input, an object of class <a href="#">Data</a>
...	additional arguments

---

size,CohortSizeDLT,ANY,Data-method
<i>Determine the cohort size based on the number of DLTs so far</i>

---

**Description**

Determine the cohort size based on the number of DLTs so far

**Usage**

```
## S4 method for signature 'CohortSizeDLT,ANY,Data'  
size(cohortSize, dose, data, ...)
```

**Arguments**

cohortSize	The rule, an object of class <a href="#">CohortSize</a>
dose	the next dose
data	The data input, an object of class <a href="#">Data</a>
...	additional arguments

---

```
size,CohortSizeMax,ANY,Data-method
```

*Size based on maximum of multiple cohort size rules*

---

### Description

Size based on maximum of multiple cohort size rules

### Usage

```
## S4 method for signature 'CohortSizeMax,ANY,Data'
size(cohortSize, dose, data, ...)
```

### Arguments

cohortSize	The rule, an object of class <a href="#">CohortSize</a>
dose	the next dose
data	The data input, an object of class <a href="#">Data</a>
...	additional arguments

---

```
size,CohortSizeMin,ANY,Data-method
```

*Size based on minimum of multiple cohort size rules*

---

### Description

Size based on minimum of multiple cohort size rules

### Usage

```
## S4 method for signature 'CohortSizeMin,ANY,Data'
size(cohortSize, dose, data, ...)
```

### Arguments

cohortSize	The rule, an object of class <a href="#">CohortSize</a>
dose	the next dose
data	The data input, an object of class <a href="#">Data</a>
...	additional arguments

---

size, CohortSizeParts, ANY, DataParts-method  
*Cohort size based on the parts*

---

### Description

Cohort size based on the parts

### Usage

```
## S4 method for signature 'CohortSizeParts,ANY,DataParts'
size(cohortSize, dose, data, ...)
```

### Arguments

cohortSize	The rule, an object of class <a href="#">CohortSize</a>
dose	the next dose
data	The data input, an object of class <a href="#">Data</a>
...	additional arguments

---

size, CohortSizeRange, ANY, Data-method  
*Determine the cohort size based on the range into which the next dose falls into*

---

### Description

Determine the cohort size based on the range into which the next dose falls into

### Usage

```
## S4 method for signature 'CohortSizeRange,ANY,Data'
size(cohortSize, dose, data, ...)
```

### Arguments

cohortSize	The rule, an object of class <a href="#">CohortSize</a>
dose	the next dose
data	The data input, an object of class <a href="#">Data</a>
...	additional arguments

---

Stopping-class	<i>The virtual class for stopping rules</i>
----------------	---

---

**Description**

The virtual class for stopping rules

**See Also**

[StoppingList](#), [StoppingMaxPatients](#), [StoppingCohortsNearDose](#), [StoppingPatientsNearDose](#), [StoppingMinCohorts](#), [StoppingMinPatients](#), [StoppingTargetProb](#) [StoppingMTDdistribution](#), [StoppingTargetBiomarker](#)

---

StoppingAll-class	<i>Stop based on fulfillment of all multiple stopping rules</i>
-------------------	---

---

**Description**

This class can be used to combine multiple stopping rules with an AND operator.

**Details**

stopList contains all stopping rules, which are again objects of class [Stopping](#). All stopping rules must be fulfilled in order that the result of this rule is to stop.

**Slots**

stopList list of stopping rules of the stopping rules into a single result

---

StoppingAny-class	<i>Stop based on fulfillment of any stopping rule</i>
-------------------	---

---

**Description**

This class can be used to combine multiple stopping rules with an OR operator.

**Details**

stopList contains all stopping rules, which are again objects of class [Stopping](#). Any of these rules must be fulfilled in order that the result of this rule is to stop.

**Slots**

stopList list of stopping rules of the stopping rules into a single result

---

StoppingCohortsNearDose-class

*Stop based on number of cohorts near to next best dose*

---

**Description**

Stop based on number of cohorts near to next best dose

**Slots**

nCohorts number of required cohorts

percentage percentage (between 0 and 100) within the next best dose the cohorts must lie

---

StoppingList-class

*Stop based on multiple stopping rules*

---

**Description**

This class can be used to combine multiple stopping rules.

**Details**

stopList contains all stopping rules, which are again objects of class [Stopping](#), and the summary is a function taking a logical vector of the size of stopList and returning a single logical value. For example, if the function all is given as summary function, then this means that all stopping rules must be fulfilled in order that the result of this rule is to stop.

**Slots**

stopList list of stopping rules

summary the summary function to combine the results of the stopping rules into a single result

---

StoppingMaxPatients-class

*Stop based on maximum number of patients*

---

**Description**

Stop based on maximum number of patients

**Slots**

nPatients maximum allowed number of patients

---

StoppingMinCohorts-class

*Stop based on minimum number of cohorts*

---

### Description

Stop based on minimum number of cohorts

### Slots

nCohorts minimum required number of cohorts

---

StoppingMinPatients-class

*Stop based on minimum number of patients*

---

### Description

Stop based on minimum number of patients

### Slots

nPatients minimum required number of patients

---

StoppingMTDdistribution-class

*Stop based on MTD distribution*

---

### Description

Has 90% probability above a threshold of 50% of the current MTD been reached? This class is used for this question.

### Slots

target the target toxicity probability (e.g. 0.33) defining the MTD

thresh the threshold relative to the MTD (e.g. 0.5)

prob required probability (e.g. 0.9)

---

StoppingPatientsNearDose-class

*Stop based on number of patients near to next best dose*

---

### Description

Stop based on number of patients near to next best dose

### Slots

nPatients number of required patients

percentage percentage (between 0 and 100) within the next best dose the patients must lie

---

StoppingTargetBiomarker-class

*Stop based on probability of target biomarker*

---

### Description

Stop based on probability of target biomarker

### Slots

target the biomarker level, relative to the maximum, that needs to be reached

prob required target probability for reaching sufficient precision

---

StoppingTargetProb-class

*Stop based on probability of target tox interval*

---

### Description

Stop based on probability of target tox interval

### Slots

target the target toxicity interval

prob required target toxicity probability for reaching sufficient precision

---

stopTrial	<i>Stop the trial?</i>
-----------	------------------------

---

**Description**

This function returns whether to stop the trial.

**Usage**

```
stopTrial(stopping, dose, samples, model, data, ...)
```

**Arguments**

stopping	The rule, an object of class <a href="#">Stopping</a>
dose	the recommended next best dose
samples	the <a href="#">Samples</a> object
model	The model input, an object of class <a href="#">Model</a>
data	The data input, an object of class <a href="#">Data</a>
...	additional arguments

**Value**

logical value: TRUE if the trial can be stopped, FALSE otherwise. It should have an attribute message which gives the reason for the decision.

---

stopTrial, StoppingAll, ANY, ANY, ANY, ANY-method
<i>Stop based on fulfillment of all multiple stopping rules</i>

---

**Description**

Stop based on fulfillment of all multiple stopping rules

**Usage**

```
## S4 method for signature 'StoppingAll,ANY,ANY,ANY,ANY'
stopTrial(stopping, dose, samples,
  model, data, ...)
```

**Arguments**

stopping	The rule, an object of class <a href="#">Stopping</a>
dose	the recommended next best dose
samples	the <a href="#">Samples</a> object
model	The model input, an object of class <a href="#">Model</a>
data	The data input, an object of class <a href="#">Data</a>
...	additional arguments

---

stopTrial,StoppingAny,ANY,ANY,ANY,ANY-method  
*Stop based on fulfillment of any stopping rule*

---

### Description

Stop based on fulfillment of any stopping rule

### Usage

```
## S4 method for signature 'StoppingAny,ANY,ANY,ANY,ANY'
stopTrial(stopping, dose, samples,
          model, data, ...)
```

### Arguments

stopping	The rule, an object of class <a href="#">Stopping</a>
dose	the recommended next best dose
samples	the <a href="#">Samples</a> object
model	The model input, an object of class <a href="#">Model</a>
data	The data input, an object of class <a href="#">Data</a>
...	additional arguments

---

stopTrial,StoppingCohortsNearDose,numeric,ANY,ANY,Data-method  
*Stop based on number of cohorts near to next best dose*

---

### Description

Stop based on number of cohorts near to next best dose

### Usage

```
## S4 method for signature 'StoppingCohortsNearDose,numeric,ANY,ANY,Data'
stopTrial(stopping,
          dose, samples, model, data, ...)
```

### Arguments

stopping	The rule, an object of class <a href="#">Stopping</a>
dose	the recommended next best dose
samples	the <a href="#">Samples</a> object
model	The model input, an object of class <a href="#">Model</a>
data	The data input, an object of class <a href="#">Data</a>
...	additional arguments

---

stopTrial,StoppingList,ANY,ANY,ANY,ANY-method  
*Stop based on multiple stopping rules*

---

### Description

Stop based on multiple stopping rules

### Usage

```
## S4 method for signature 'StoppingList,ANY,ANY,ANY,ANY'
stopTrial(stopping, dose, samples,
          model, data, ...)
```

### Arguments

stopping	The rule, an object of class <a href="#">Stopping</a>
dose	the recommended next best dose
samples	the <a href="#">Samples</a> object
model	The model input, an object of class <a href="#">Model</a>
data	The data input, an object of class <a href="#">Data</a>
...	additional arguments

---

stopTrial,StoppingMaxPatients,ANY,ANY,ANY,Data-method  
*Stop based on maximum number of patients*

---

### Description

Stop based on maximum number of patients

### Usage

```
## S4 method for signature 'StoppingMaxPatients,ANY,ANY,ANY,Data'
stopTrial(stopping, dose,
          samples, model, data, ...)
```

### Arguments

stopping	The rule, an object of class <a href="#">Stopping</a>
dose	the recommended next best dose
samples	the <a href="#">Samples</a> object
model	The model input, an object of class <a href="#">Model</a>
data	The data input, an object of class <a href="#">Data</a>
...	additional arguments

---

stopTrial, StoppingMinCohorts, ANY, ANY, ANY, Data-method  
*Stop based on minimum number of cohorts*

---

### Description

Stop based on minimum number of cohorts

### Usage

```
## S4 method for signature 'StoppingMinCohorts,ANY,ANY,ANY,Data'
stopTrial(stopping, dose,
          samples, model, data, ...)
```

### Arguments

stopping	The rule, an object of class <a href="#">Stopping</a>
dose	the recommended next best dose
samples	the <a href="#">Samples</a> object
model	The model input, an object of class <a href="#">Model</a>
data	The data input, an object of class <a href="#">Data</a>
...	additional arguments

---

stopTrial, StoppingMinPatients, ANY, ANY, ANY, Data-method  
*Stop based on minimum number of patients*

---

### Description

Stop based on minimum number of patients

### Usage

```
## S4 method for signature 'StoppingMinPatients,ANY,ANY,ANY,Data'
stopTrial(stopping, dose,
          samples, model, data, ...)
```

### Arguments

stopping	The rule, an object of class <a href="#">Stopping</a>
dose	the recommended next best dose
samples	the <a href="#">Samples</a> object
model	The model input, an object of class <a href="#">Model</a>
data	The data input, an object of class <a href="#">Data</a>
...	additional arguments

---

`stopTrial, StoppingMTDdistribution, numeric, Samples, Model, ANY-method`  
*Stop based on MTD distribution*

---

**Description**

Stop based on MTD distribution

**Usage**

```
## S4 method for signature 'StoppingMTDdistribution, numeric, Samples, Model, ANY'
stopTrial(stopping,
  dose, samples, model, data, ...)
```

**Arguments**

<code>stopping</code>	The rule, an object of class <a href="#">Stopping</a>
<code>dose</code>	the recommended next best dose
<code>samples</code>	the <a href="#">Samples</a> object
<code>model</code>	The model input, an object of class <a href="#">Model</a>
<code>data</code>	The data input, an object of class <a href="#">Data</a>
<code>...</code>	additional arguments

---

`stopTrial, StoppingPatientsNearDose, numeric, ANY, ANY, Data-method`  
*Stop based on number of patients near to next best dose*

---

**Description**

Stop based on number of patients near to next best dose

**Usage**

```
## S4 method for signature 'StoppingPatientsNearDose, numeric, ANY, ANY, Data'
stopTrial(stopping,
  dose, samples, model, data, ...)
```

**Arguments**

<code>stopping</code>	The rule, an object of class <a href="#">Stopping</a>
<code>dose</code>	the recommended next best dose
<code>samples</code>	the <a href="#">Samples</a> object
<code>model</code>	The model input, an object of class <a href="#">Model</a>
<code>data</code>	The data input, an object of class <a href="#">Data</a>
<code>...</code>	additional arguments

---

```
stopTrial, StoppingTargetBiomarker, numeric, Samples, DualEndpoint, ANY-method
```

*Stop based on probability of targeting biomarker*

---

**Description**

Stop based on probability of targeting biomarker

**Usage**

```
## S4 method for signature
## 'StoppingTargetBiomarker, numeric, Samples, DualEndpoint, ANY'
stopTrial(stopping,
  dose, samples, model, data, ...)
```

**Arguments**

stopping	The rule, an object of class <a href="#">Stopping</a>
dose	the recommended next best dose
samples	the <a href="#">Samples</a> object
model	The model input, an object of class <a href="#">Model</a>
data	The data input, an object of class <a href="#">Data</a>
...	additional arguments

---

```
stopTrial, StoppingTargetProb, numeric, Samples, Model, ANY-method
```

*Stop based on probability of target tox interval*

---

**Description**

Stop based on probability of target tox interval

**Usage**

```
## S4 method for signature 'StoppingTargetProb, numeric, Samples, Model, ANY'
stopTrial(stopping,
  dose, samples, model, data, ...)
```

**Arguments**

stopping	The rule, an object of class <a href="#">Stopping</a>
dose	the recommended next best dose
samples	the <a href="#">Samples</a> object
model	The model input, an object of class <a href="#">Model</a>
data	The data input, an object of class <a href="#">Data</a>
...	additional arguments

---

summary,Simulations-method

*Summarize the simulations, relative to a given truth*

---

### Description

Summarize the simulations, relative to a given truth

### Usage

```
## S4 method for signature 'Simulations'
summary(object, truth, target = c(0.2, 0.35), ...)
```

### Arguments

object	the <a href="#">Simulations</a> object we want to summarize
truth	a function which takes as input a dose (vector) and returns the true probability (vector) for toxicity. Additional arguments can be supplied via ....
target	the target toxicity interval (default: 20-35%) used for the computations
...	additional arguments affecting the summary produced.

### Value

an object of class [Simulations-summary](#)

---

update,Data-method

*Update method for the "Data" class*

---

### Description

Add new data to the [Data](#) object

### Usage

```
## S4 method for signature 'Data'
update(object, x, y, ID = (if (length(object@ID))
  max(object@ID) else 0L) + seq_along(y), ...)
```

### Arguments

object	the old <a href="#">Data</a> object
x	the dose level (one level only!)
y	the DLT vector (0/1 vector), for all patients in this cohort
ID	the patient IDs
...	Additional arguments to the call, or arguments with changed values. Use name = NULL to remove the argument name.

### Value

the new [Data](#) object

---

update,DataParts-method

*Update method for the "DataParts" class*

---

### Description

Add new data to the [DataParts](#) object

### Usage

```
## S4 method for signature 'DataParts'
update(object, x, y, ID = (if (length(object@ID))
  max(object@ID) else 0L) + seq_along(y), ...)
```

### Arguments

object	the old <a href="#">DataParts</a> object
x	the dose level (one level only!)
y	the DLT vector (0/1 vector), for all patients in this cohort
ID	the patient IDs
...	Additional arguments to the call, or arguments with changed values. Use name = NULL to remove the argument name.

### Value

the new [DataParts](#) object

---

&,Stopping,Stopping-method

*The method combining two atomic stopping rules*

---

### Description

The method combining two atomic stopping rules

### Usage

```
## S4 method for signature 'Stopping,Stopping'
e1 & e2
```

### Arguments

e1	First <a href="#">Stopping</a> object
e2	Second <a href="#">Stopping</a> object

### Value

The [StoppingAll](#) object

---

&,Stopping,StoppingAll-method

*The method combining an atomic and a stopping list*

---

### Description

The method combining an atomic and a stopping list

### Usage

```
## S4 method for signature 'Stopping,StoppingAll'
e1 & e2
```

### Arguments

e1                    [Stopping](#) object  
e2                    [StoppingAll](#) object

### Value

The modified [StoppingAll](#) object

---

&,StoppingAll,Stopping-method

*The method combining a stopping list and an atomic*

---

### Description

The method combining a stopping list and an atomic

### Usage

```
## S4 method for signature 'StoppingAll,Stopping'
e1 & e2
```

### Arguments

e1                    [StoppingAll](#) object  
e2                    [Stopping](#) object

### Value

The modified [StoppingAll](#) object
